PLANET
GREENER

The cycle of EcoMotion system

BLUE VEHICLE: NEW BATTERIES
on the way to the customer (two stops - wholesaler and retailer).

RED VEHICLE (COLLECTOR): USED BATTERIES
on the way to the smeltery (two stops - retailer and wholesaler).

What is EcoMotion?

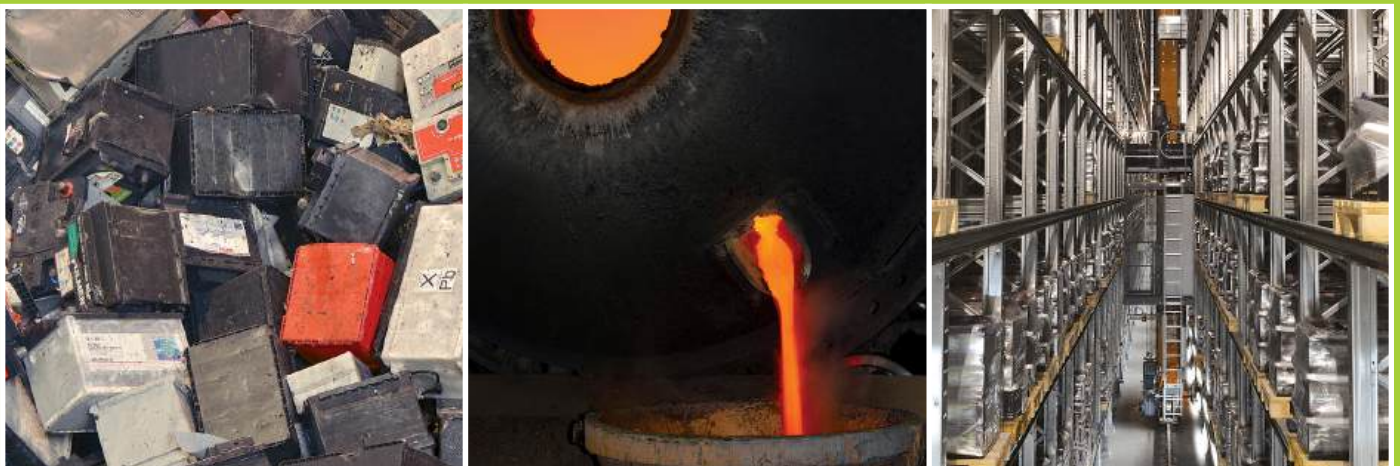

EcoMotion is TAB's completed lifelasting cycle of a battery; from its production to the recycling. It means TAB is selling new batteries and with its own smeltery collecting the old (used) batteries through its own (commercial/selling/...) network.

TAB is not only a producer of high quality Pb batteries but it is also taking care of ecological removal and decomposition-recycling of used batteries. With participation in the process of **EcoMotion** the consumer of the battery can be sure that all returned batteries to TAB and their lead content will be reused and that all procedures required by law will be respected.

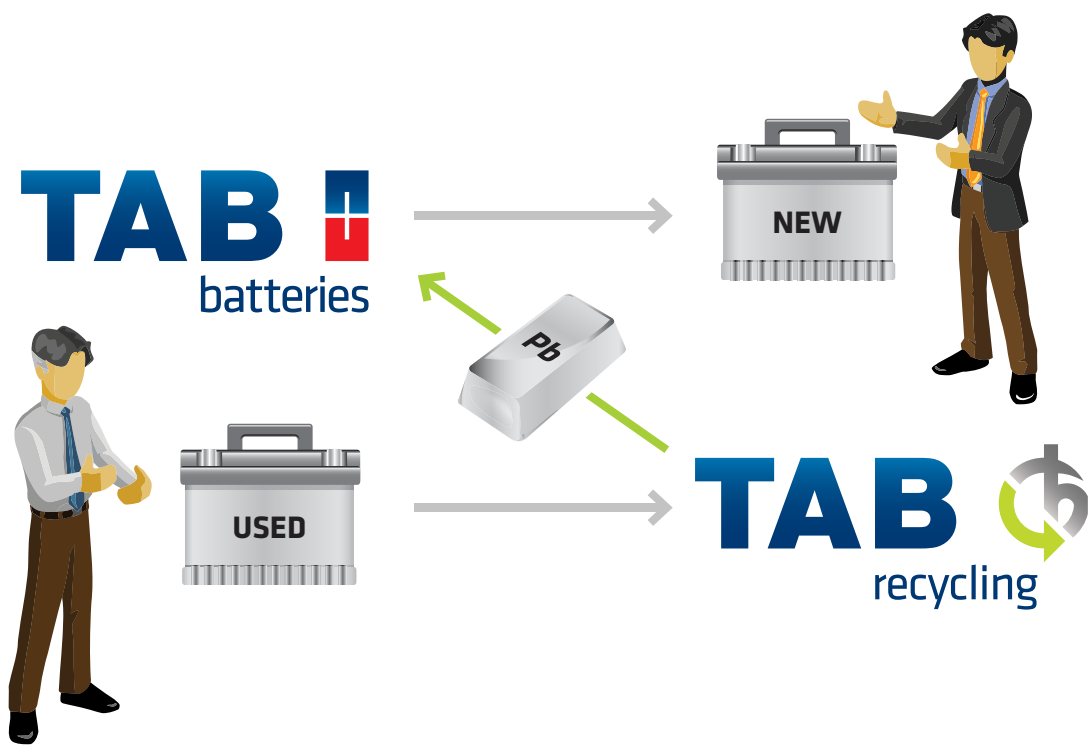

Why choose EcoMotion?

- + Reuse of lead, polypropylene and sulphuric acid that we have obtained from used batteries
- + Preserving natural resources and environment
- + Respecting "environmental laws"
- + Faster collecting system
- + Free of charge for the user

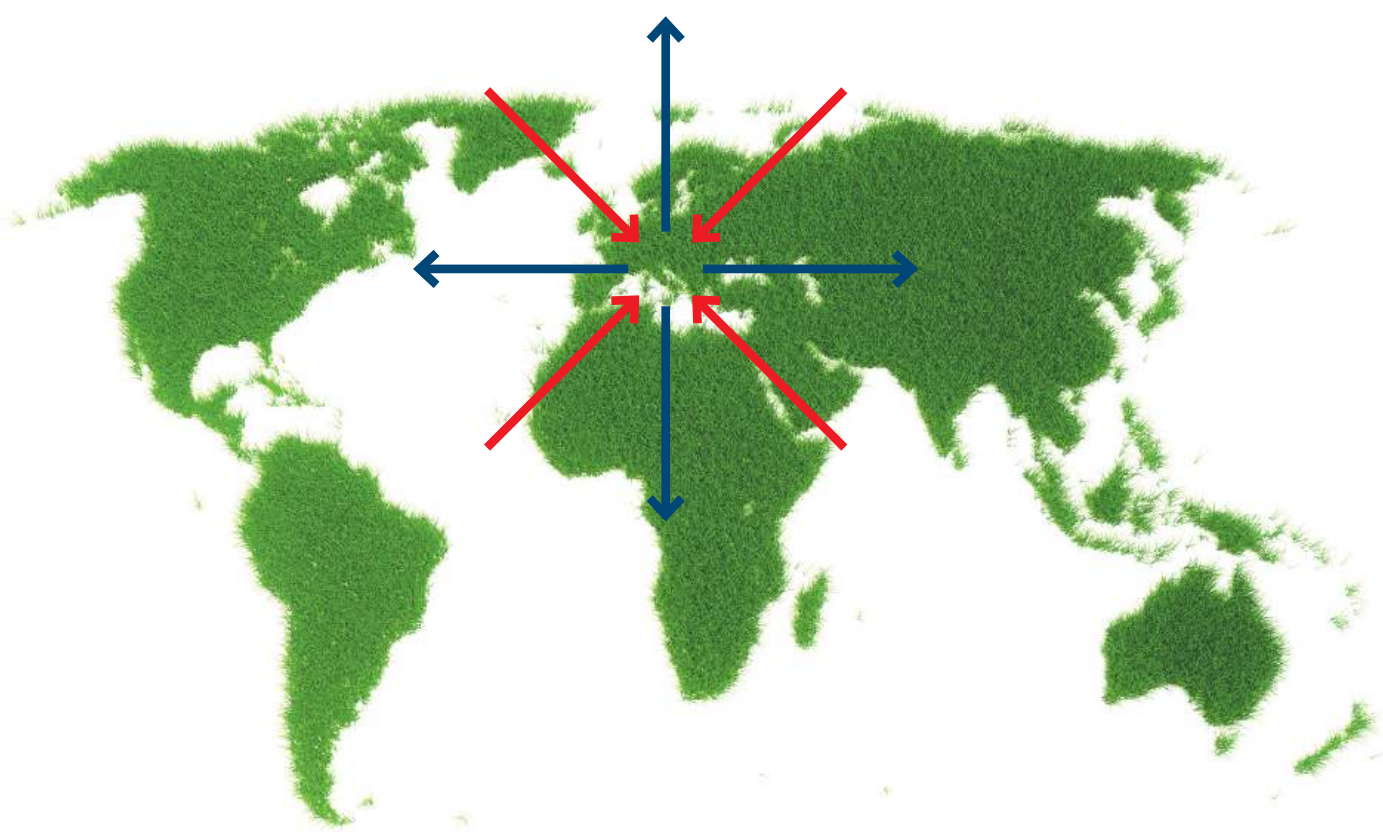

EcoMotion is the procedure of recycling which is helping to preserve nature responsibly. Contribute to the protection of the environment by replacing your battery with us.
